

Up Bank → YNAB Sync

Setup checklist & worksheet

Print this out and tick off each step as you go. Space is included below for the keys and IDs you'll collect along the way, so you don't have to keep them all in your head. Full instructions for every step are in the project's README — this sheet is just a companion to it.

This sheet will hold real API keys and secrets once filled in. Treat it like a password: don't photograph it, leave it out, or leave it lying around once you're finished. Shred it (or securely dispose of it) once your setup is working and you no longer need to refer back to it.

Step 1 Install the tools you need

- ☐ Homebrew installed (Mac only)
- ☐ Node.js installed
- ☐ Yarn installed
- ☐ Checked `node --version` and `yarn --version` both work
- ☐ A text editor installed (e.g. VS Code)

Step 2 Download the code

- ☐ Repo downloaded (git clone or ZIP) and unzipped
- ☐ Folder opened in text editor

Step 3 Get your Up Bank API key

- ☐ Personal Access Token generated at api.up.com.au/getting_started

Up API key (starts with `up:yeah:`)

Step 4 Get your YNAB API key

- ☐ New Token created at app.youneedabudget.com/settings/developer

YNAB API key

Step 5 Set up AWS

- ☐ AWS account created
- ☐ IAM user created with AdministratorAccess
- ☐ Access key created for that IAM user
- ☐ AWS CLI installed
- ☐ Ran `aws configure` with the access key, secret key, and region

AWS Access Key ID

AWS Secret Access Key

AWS region used (e.g. ap-southeast-2)

Step 6 Map Up accounts to YNAB accounts

- ☐ `accountMapping.json` created from the `.example` file
- ☐ Up account IDs looked up via the API
- ☐ YNAB account IDs copied from account URLs
- ☐ Every account (incl. catchall, if used) added to `accountMapping.json`

Account name	Up account ID	YNAB account ID

Step 7 Add your secret keys

- ☐ `.env` created from `.env.example`
- ☐ `UP_API_KEY`, `YNAB_API_KEY` and `YNAB_BUDGET_ID` filled in
- ☐ `UP_WEBHOOK_SECRET` left blank for now

YNAB Budget ID (from the budget URL)

Step 8 Install dependencies and deploy

- ☐ Ran yarn to install dependencies
- ☐ Ran yarn sls deploy
- ☐ Copied the endpoint URL from the deploy output
- ☐ Registered the webhook with Up via curl
- ☐ Copied the secretKey from the response into UP_WEBHOOK_SECRET
- ☐ Ran yarn sls deploy again
- ☐ Checked CloudWatch logs or made a test transaction to confirm it's working

Webhook endpoint URL

Webhook secret (UP_WEBHOOK_SECRET)

Full step-by-step instructions, troubleshooting, and explanations for everything above are in the project's README.md.
